“A Note on Dominating Fractional Factorial 2-Level Designs With Clear Two-Factor Interactions”

Instructions for obtaining the development version 0.7 of R-package igraph

Windows users who are on R version 2.15.x can e-mail the author (groemping@bht-berlin.de) for obtaining the igraph 0.7 development version used in the paper's searches (about 6.64MB).

Current development files for package igraph can be accessed at <https://code.google.com/p/igraph/downloads/list>. However, be warned that these development versions do not always install on all platforms.

- Make sure to get the 0.7-main tree for R (tar.gz file).
- Windows users whose machines are not set up to build packages that need compilation can have the package built on <http://win-builder.r-project.org/>; however, it will be necessary to unpack the tar.gz file, change the maintainer e-mail address in the “Description” file and repack everything (using **R CMD build**, which requires the Rtools to be installed), in order to direct the notification e-mail to you instead of the actual package maintainer.
